SOLANA MOBILE CLOCK IN

AskLens Guard

Tap Share on any link or wallet address. Get a green, amber or red answer.

An Android app for Solana Seeker owners. Solo build by Adel, Nigeria.

THE PROBLEM

On a phone, you copy things you can't check.

A link in a group chat

It says "claim your airdrop". Maybe it's a fake dApp Store page.

An address from a stranger

Looks right at the start and end. Address poisoning counts on that.

No pause built in

Copy, paste, sign. The check, if any, happens after the money moves.

WHAT IT DOES

Share it to AskLens Guard and see if it's safe before you open or pay.

It lives in the Android share menu, so it works from Telegram, X and the browser without copying anything around.

HOW IT WORKS

Share menu to verdict, in a few seconds.

1

Share

Pick AskLens Guard in the share sheet.

2

Live check

Links go to three live Telegraph checkers at once.

3

Wallet facts

Solana addresses get a profile: balance, age, activity, tokens.

4

Proof

Save a signed receipt of the check on Solana.

PLACEHOLDER Capture: Home screen with the paste box, streak and "scams caught" count.

PLACEHOLDER Capture: a Result screen showing a big red or amber verdict for a link. File:

THE SOLANA PART

Connect your wallet. Keep a receipt you can show anyone.

- Connect with Mobile Wallet Adapter, the same way Seeker apps do.
- Wallet profile read from the Solana network: balance, age, transaction count, top tokens.
- Save proof sends a small memo transaction: the verdict, a short fingerprint of what you checked, and a time. Open it in the explorer.

PLACEHOLDER Capture: Wallet screen, connected, showing balance and top tokens.

PLACEHOLDER Capture: the saved proof / explorer link after "Save proof on Solana". File:

WHY MOBILE

The risky moment happens in a chat app, on a phone.

Android share sheet

The check sits one tap from where the link arrives. No copy, no switching apps.

Wallet connect

Mobile Wallet Adapter signs the receipt in the wallet app you already use.

Seeker owners

Self-custody phone, dApp Store, constant exposure to new links and addresses.

WHY PEOPLE COME BACK

You check things every day, so it should keep count.

Daily streak

Days in a row you checked before you tapped.

Risky things caught

A running count of amber and red results.

History

Your last 100 checks, so you can find that link again.

Share card

Catch something, post a picture of it, warn your group.

WHAT ALREADY EXISTS

AskLens is live. The Android app is new.

ClipGuard for Windows

Checks copied links and 0x addresses from the tray.

MetaMask Snap

Wallet risk warning before you approve.

MCP for Claude and Cursor

One check_this action for a link, address or transaction.

Telegraph Season I, Track 3

The existing entry. Two Telegraph miners run by us.

Built during this hackathon: the Android app, share-to-check, Solana wallet profile, signed receipts, streak and share card.

HONEST STATUS

What's real today, and what isn't.

Real

- Share a link in and get a verdict from the live service
- Ethereum 0x address checks (slower, often "not sure")
- History, streak, share card
- Solana wallet profile from the Solana network
- App compiles and bundles for Android

Limits

- The live service doesn't check Solana addresses. We show wallet facts, not a scam verdict, and the screen says so.
- About 10 checks per 10 minutes per phone
- Proof receipt: code written, devnet send not yet proven end to end
- Not yet tested on a physical phone at time of writing

WHAT'S NEXT

Roadmap

- Real Solana address verdicts once a Solana checker is live, and a Seeker dApp Store listing.
- Warn before a pasted address looks like one you've sent to before.

Code and APK
